To ensure that tap water is safe to drink, the U.S. EPA prescribes regulation limiting the amount of certain contaminants in water provided by public water systems. U.S. Food and Drug Administration regulations establish limits for contaminants in bottled water, which must provide the same protection for public health. Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of these contaminants does not necessarily indicate that the water poses a health risk.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it can acquire naturally occurring minerals, in some cases radioactive material, and substances resulting from the presence of animals or from human activity. Substances that may be present in source water include:

- microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, or wildlife;
- inorganic contaminants, such as salts and metals, which can be naturally occurring or may result from urban stormwater runoff, industrial or domestic wastewater discharges, or radioactive material, and substances resulting from the presence of animals or from human activity. Substances that may be present in source water include: microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, or wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or may result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses; organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and which may also come from gas stations, urban stormwater runoff, and septic systems; radioactive contaminants, which can be naturally occurring or may be the result of oil and gas production and mining activities.

Contaminants may be found in drinking water that may cause taste, color or odor problems. These types of problems are not necessarily causes for health concerns. For more information on taste, odor or color of drinking water, please contact our business office. For more information about contaminants and potential health effects, call the U.S. EPA’s Safe Drinking Water Hotline at (800) 426-4791.
Where Does Grand Prairie Water Come From?

Grand Prairie’s drinking water is obtained from both surface and ground water sources and has maintained its “Superior” water quality rating.

Grand Prairie surface water supplies are purchased from the cities of Dallas, Fort Worth, and Midlothian. Dallas treats and uses surface water from seven sources: the Elm Fork of the Trinity River, and lakes Grapevine, Lewisville, Ray Hubbard, Ray Roberts, Tawakoni and Fork.

For Worth’s drinking water sources include: Lake Benbrook, Lake Bridgeport, Eagle Mountain Lake, Lake Worth, Cedar Creek and Richland Chambers Reservoirs and the Clear Fork Trinity River.

For Midlothian’s drinking water sources include: Joe Pool Lake, Richland Chambers and the Cedar Creek Reservoirs.

Grand Prairie uses up to 10 ground water wells, mainly during the summer to meet demand. The wells have an average depth of 2,000 feet and are pumped from the Trinity Aquifer.

Source Water Assessment

The TCEQ completed a source water assessment and results indicate that some of our sources are susceptible to certain contaminants. The sampling requirements for our water system are based on this susceptibility and previous sample data. The susceptibility of our purchase water sources is not included in this assessment. For more information on source water assessment and protection efforts, please contact us at (972) 237-8055.

Questions

For more information about this report, contact Cindy Mendez at the Environmental Services Department at (972) 237-8055.

Additional copies of the Water Quality Report are available in the Environmental Services Department office at 206 West Church Street, 2nd floor, or visit the City website at www.gptx.org.

Public Participation

To participate in decisions concerning water, attend Grand Prairie City Council meetings on the first and third Tuesday of each month at 6:30 p.m. in Council Chambers located at City Hall, 317 West College Street. For more information about public participation at council meetings, call (972) 237-8035.

Household Hazardous Waste

The City collects household hazardous wastes, which should not be put in the garbage or washed down the drain. To drop off household hazardous waste at one of the City’s collection events, register at www.gptx.org/WQ/HHW.

Information on the Internet

The U.S. EPA Office of Water (www.epa.gov/watrhome) and the Centers for Disease Control and Prevention (www.cdc.gov) websites provide a substantial amount of information on many issues relating to water resources, water conservation and public health.

Fun Facts

The average pool takes 22,000 gallons of water to fill.

- Pick up after your dog with a small bag and toss it in the trash.
- Set up a waste digester - its like having a pet septic system.
- Reuse plastic produce or shopping bags to pick up pet waste.
- Keep cats indoors, they will be healthier, live longer, and won’t contribute to water pollution.
- Remember to pick up pet waste in your yard at least weekly.

**DEFINITIONS**

**AL (Action Level)**
The concentration of a contaminant, which if exceeded, triggers treatment or other requirements that a water system must follow.

**MCL (Maximum Contaminant Level)**
The highest level of a contaminant allowed in drinking water. MCLs are set as close as possible to the MCLGs achievable using the best available treatment technology.

**MCLG (Maximum Contaminant Level Goal)**
The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.
Tap water samples were collected for lead and copper analysis from sample sites throughout the community.

</tbody>
</table>

**DEFINITIONS (CONTINUED)**

MRDL (Maximum Residual Disinfectant Level)
The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

MRDLG (Maximum Residual Disinfectant Level Goal)
The level of drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

mrem/year (mili-Roentgen equivalent man per year)
A measurement of radioactivity.

NA
Not applicable.

pCi/L (picocuries per liter)
A measure of radioactivity.

ppm (parts per million)
One part substance per million parts of water (or milligrams per liter).

ppb (parts per billion)
One part substance per billion parts water (or micrograms per liter).

TT (Treatment Technique)
A required process intended to reduce the level of a contaminant in drinking water.

The MCL for beta particles is 4 mrem/year. U.S. EPA considers 50 pCi/L to be the level of concern for beta particles.

In the water loss audit submitted to the Texas Water Development Board for the time period of Jan-Dec 2015, our system lost an estimated 1,132,295,956 gallons of water. If you have any questions about the water loss audit, please call (972) 237-8055.

**Fun Facts**

75% of the human brain is water and 75% of a living tree is water. Water makes up about 66 percent of the human body.
When you see a hydrant flowing water, it is typically for one of the following reasons and all of them have to do with protecting public health.

**Dead end flushing**
All cities in Texas are required to flush areas called Dead Ends, which are like dead end streets. To keep water flowing in dead ends, a hydrant is opened to maintain disinfectant residual and palatable water.

**Super-chlorinating and new construction**
The water system has to be occasionally cleaned by adding high doses of chlorine to the pipes. New lines are also super-chlorinated before they are put into service. Super-chlorinated water cannot be consumed by the public and is released by a hydrant once cleaning completes.

**Unidirectional flushing (UDF)**
UDF cleans the water mainlines by flushing sequences with the water being discharged from a hydrant, removing mineral deposits, sediments and biological deposits that accumulate.

**Servicing groundwater wells**
During times of peak water demand, the City may turn on demand wells that need to be flushed before they can be put into the water system.

**Fire department tests**
Annually, the Fire Department is required to have the water system tested to make sure adequate pressure exists to fight fires which may include opening hydrants.

**Wash down after sanitary sewer overflow (SSO)**
A SSO is any overflow, spill or diversion of untreated wastewater from a sanitary sewer system. As part of the cleanup process, hydrants may open to wash a street down or flush out a storm drain of pollutants. That water is typically pumped back into the repaired sewer.
